. . 41. 3) path. This mechanism allows data to be sent over the network without. Posted by After opening this camp with his new deal, the Blues asked Rick Rypien to return to the AHL and continue his development. The expectation was that Rypien could be a fixture on the third line in St. Louis next season. That's where he's spent the majority of his time in the AHL. Vivianne Miedema of the Washington Spirit scored the game-winning goal in the 93rd minute to give the Spirit a 2-1 win in St. Louis on Saturday. Rypien couldn't score on the night, but he was useful for a change. He played mostly in the defensive zone, but he had a few loose puck situations. He had no impact on the game and was occasionally out of position, but the Blues have a history of using him as a third-pairing defender in the AHL. In 74 games with Chicago this season, he recorded just 10 points. The Blues will probably get more production from Rypien on the penalty kill — which is one of the strengths of his game. Rypien has already played 9:46 in a game on the PK this season in Chicago. the timing of the response: the longer the response delay, the lower the number of correct responses. The position of the delay in time can be determined in order to obtain a given number of correct responses. After, the parameters of the exogenous response and the parameter of the endogenous response are adjusted to obtain the desired number of correct responses. In a yet another embodiment, two or more different exogenous responses are used. In a further embodiment of the present invention, the exogenous response can be changed in a way that the person controlling the system can influence the response. Thus, by altering the input signal, the response of the neural system can be influenced. In another embodiment of the present invention, the exogenous response is adapted to the endogenous response. Thus, the moment of the exogenous response is continuously adapted to the endogenous response. In a further embodiment of the present invention, feedback control can be used to control the parameters of the exogenous response. Thus, by adjusting the parameters of the exogenous response, the learning can be improved. According to the present invention, the timing of the response is provided, while at the same time the neural system is provided with a
