In today's day and age, many photographers are spending more time socializing on social media sites than taking pictures. This is creating a need for a new way to share images that works on all platforms. In recent years, communication through different gadgets has increased greatly. So, don't just use other applications and expect that Photoshop looks as good. Adobe Photoshop is the design workhorse that helps people create and share images in every lifestyle and professional scenario. The updated version 10 features include the following improvements:

- Redesigned search that makes finding content in Photoshop faster and more intuitive
- Object Selection: Enables users to easily make selections in both foreground and background images, even when the image is part of a multi-layered document, so it's possible to edit just the selected elements without eliminating ones in other layers.
- Remove Background: The new Remove Background tool removes the background of any photo or image. This tool lets users quickly select the areas that they want to keep while removing the parts of the image that they don't. Since it only works with layers and not with the entire image, it's easy enough to use for even beginners.
- Tool Preference: You can now customize the way Photoshop works by changing settings that you usually adjust from the right-click menu. For example, you can now change the default settings for the Adjustment Brush and the Puppet Warp tool. Both tools feel more natural when they're in certain modes. Also, you can now change the color of the preview panel and the size of the layers window.
- Research Panel: The Research Panel displays the types of content that are similar to an element, which allows users to choose the area of an image that they want to keep.
